

Do you want to get better data from your experiments and use fewer animals?

Then attend our Training School in Experimental Design and Statistical Analysis.

18th -21st April 2010

The University of
Nottingham

Sponsored by

It will give you:

An appreciation of the factors you need to consider when designing an experiment. As well as the basic skills needed to design and analyse your work in such a way as to refine the procedures and housing, minimise the number of animals needed and to maximise the quality and relevance of the scientific output .

Past participants said:

'Very good meeting...should be held again as few courses take animal research/small group statistics considerations into account'

'Course is very good and almost obligatory for any PhD student'

'Gave a good indication as to why statistics are employed and why they are needed in scientific work'

'This will change how I think about experimental design'
